October, 1988

Preface

This report presents Alberta census division population projections to the year 2001. These projections were developed by the Alberta Bureau of Statistics and have been reviewed by a committee comprised of representatives from nine government departments and agencies.

The Bureau would like to thank the following departments and their representatives for reviewing these projections and providing their valuable comments:

Career Development and Employment
Energy Resources Conservation Board
Social Services
Education
Health
Environment
Economic Development and Trade
Treasury
Municipal Affairs.

This report provides three sets of projections consistent with the provincial long-term projection Series 1, 5, and 9 (lowest, medium, and highest projections). Series 2, 3, 4, 6, 7, and 8 consistent with the provincial series are available upon request. Detailed data on Series 1, 5, and 9 by five-year age group and sex are computer accessible via ASIST (Alberta Statistical Information System).

Users are encouraged to consult the Bureau if any questions arise in using these data or to request additional copies of the report by contacting:

CENSUS DIVISION POPULATION PROJECTIONS

INTRODUCTION

This report presents Alberta census division population projections for 1987-2001. The contents include a summary table providing total population and growth rates for the selected three series for selected years; the assumptions on fertility, mortality, and net migration; a brief discussion on methodology; and the projection results. These projections were prepared using 1986 census counts by age and sex for the base year input. A cohort component approach was used in deriving the census division population projections to the year 2001. In a few census divisions (3, 5, and 18) some adjustments were needed to smooth the trend. This was done using a share analysis approach. While all the projection series use 1986 survival ratios, different fertility and migration assumptions are used for each series. Series 1 employs the low fertility and the low migration assumption; series 5, the medium fertility and medium migration assumption; and series 9 the high fertility and high migration assumption. These assumptions are consistent with the assumptions for the Bureau's provincial population projections.

These census division projections will provide a good baseline set of numbers on which future economic scenarios can be overlaid. In developing these projections, no explicit assumptions regarding the regional impact of oil sands plants and other major developments were considered. Instead, an approach was used where a base period was chosen and the distribution of provincial migration across census divisions that existed in this base period were assumed to exist in the future. The 1981-86 period was chosen as it is beyond the impact of the dramatic inflows of the 1970's and is thought to be reasonably representative, in terms of regional growth patterns, for projected growth in the future. If resource and other major developments are thought likely to attract migration to a census division over and above the proportion which existed in 1981-86, the baseline projection would have to be altered.

The report presents key data on the census division population projections; the more detailed data by five year age group and sex for Series 1, 5, and 9 are computer accessible through ASIST (Alberta Statistical Information System), or are available by contacting our Data and Methodological Services Unit.

Population Trends to 2001

All census division populations are expected to grow during the 1987-2001 period. A fairly wide range in the growth rates of census divisions is evident (Table 1), reflecting differences in their economic and demographic bases. For the purpose of the following analysis, census divisions falling within a specific range of growth rates are grouped together. The analysis is based on Series 5--the medium projection.

Of the more rapidly growing census divisions (12, 14, 16, 17 and 18), most lie in the northern part of the province. Growth in these divisions likely reflects the impact of resource development during the 1981-86 base period (which is assumed to continue in the future) as well as the higher fertility and younger population in these areas than in the rest of the province. These census divisions are expected to grow in the range of 1.6-2.0% per annum during the next fifteen years. Division 16 (Fort McMurray)* shows an annual growth rate of 2.0%, highest in the province. The population of this division is likely to reach 65,500 by 2001. The census divisions with the next highest growth rate are 12 (St. Paul) and 17 (Peace River), each growing at a 1.9% annual rate.

The two major urban census divisions, division 6 (Calgary) and 11 (Edmonton), which together share two-thirds of the provincial

---

* The major urban centre in the census division is shown in parentheses.

population, are expected to grow at annual rates of 0.9% and 1.0%, respectively, closely approximating the provincial average. Census division 11 shows a slightly higher growth rate than 6, as a result of higher fertility rates. The population of divisions 6 and 11 is expected to grow to 823,700 and 934,800, respectively, by 2001.

The remaining census divisions comprise generally the central and southern portions of the province and are, for the most part, affected more by the agricultural economy than resource developments. With respect to growth rates, these divisions can be classified into two groups--one above the provincial average, the other below. Those divisions which have growth rates slightly above the provincial average of 1.0% are 3, 4, 5, 8, 15, and 19, with rates about 1.2%. The other group, which has rates falling in the range of .3 to .9%, is comprised of divisions 1, 2, 7, 10, and 13. Although many characteristics of the two groups are similar, various divisions in the first are subject to factors which boost their growth beyond that of neighbouring census divisions. These include a high fertility rate in division 3 (Pincher Creek)*; high migration, reflecting petrochemical development in division 8 (Red Deer); and migration related to the tourism industry in division 15 (Banff).

Methodology

A cohort survival model was used to produce Alberta census division population projections. The operation of the model requires a base population by single year of age and sex, and separate projections of fertility, mortality and net migration.

---

* The major urban centre in the census division is shown in parentheses.

The model also requires proportional distribution of total fertility rates and the age and sex structure of migrants. The basic procedure of the model includes the addition of births, subtraction of deaths, and addition of net migration to the base population.

The 1986 census data by age and sex were used as base input. In seven out of nineteen divisions (Divisions 3, 6, 8, 11, 12, 15, and 16), census counts were adjusted for incomplete enumeration in the Indian reserves and settlements to accurately reflect the population of the affected divisions.

The assumptions on fertility, mortality and migration are briefly discussed in the following paragraphs:

Fertility -- Three fertility assumptions, a low, a medium, and a high, were developed using a ratio approach. The census divisions' total fertility rates for 1981 to 1986 were examined and average ratios of census division to provincial total fertility rates were calculated. These ratios were applied to provincial total fertility assumptions (used in the Bureau's long-term provincial projections released in spring 1988) to obtain the individual census division assumptions. The key assumption in the fertility projections is that the ratio will continue throughout the projection period. The proportional distribution of total fertility rates into age specific rates was calculated for each census division for 1986 and kept constant throughout the projection period.

Migration -- Three migration assumptions, a low, a medium, and a high, were developed for census division population projections. A ratio approach, similar to the one used in the projection of census divisions' total fertility rates, was followed in deriving census divisions' net migration assumptions. Based on a trend analysis of historical data on

migration, it was assumed that the 1981-86 pattern of census divisions' share of provincial net migration will continue. The proportional distribution of Alberta net migration by census division for each year during the 1981-86 period was calculated and averaged over the five year period. The average proportional distribution was applied to the projected net migration for the province (released in Spring 1988) to yield the census divisions' net migration.

The age-sex distribution of migrants is an important element in the projection process. This distribution takes the assumed net total migration for the census division and distributes the total into age and sex components. Due to a lack of migration data on age and sex for small areas, it was not possible to make an assumption on age-sex composition of migrants for each division separately. Therefore, it is assumed that the age-sex composition of migrants for all census divisions will follow the provincial pattern.

Mortality -- As opposed to three fertility, and three migration assumptions for each census division, only one set of mortality assumptions was used in the projection of census division population. This reflects the relative stability of this component in comparison to the other two. The projection model uses life-table survival ratios in calculating projected deaths for each census division. In areas with small population, deaths for every single year of age may not necessarily occur. Hence, construction of life-tables for each census division was not possible due to this limitation. To overcome this difficulty, based on their mortality patterns, all divisions were grouped into three distinct regions: a southern region, a central region, and a northern region. The southern region was formed by grouping census divisions 1, 2, 3, 4, 5, 7, 9, and 15; the central region is comprised of divisions 6, 8, and 11; and the northern region

includes divisions 10, 12, 13, 14, 16, 17, 18, and 19. Survival ratios were computed for each region using 1985-87 death statistics and the 1986 census population counts.

PROJECTION SUMMARY AND ASSUMPTIONS
